Zhmud Vadim A.

Z 62 Numerical Optimization of Regulators for Automatic Control System: Textbook for higher education / Vadim A. Zhmud, Lubomir V. Dimitrov, Jaroslav Nosek. – Novosibirsk: NSTU Publisher, 2019. – 296 p.

ISBN 978-5-7782-3802-2

The book is intended for students and PhD students in the field of automatics, mechatronics, robotics, digital or analog feedback control. Particullary, in NSTU (Novosibirsk, Russia) it is intended for the students enrolled in the educational field 27.03.04 “Control in Technical Systems” in the course “Computer-aided design tools and control systems” (for Bachelors in their 4th year). It includes training materials and guidelines for self-assessment (questions for self-testing).

The basic knowledge of previously studied mathematical disciplines is required for successful study of this course.

The book is prepared due to the financial support from the European Foundation Erasmus+, projects KA-107A and SmartCity.

Content

Introductory words....7

1. Introduction....8

1.1. The subject of study: locked dynamical control systems....8

1.2. Feature of ACS: negative feedback....10

1.3. The task of regulator calculation....15

1.4. Questions for self-control....18

2. Terminology and mathematical tools of TAC....20

2.1. Basic requirements and mathematical tools for the system....20

2.2. Requirements for the possibility of the physical realization of the model....22

2.3. The choice of the regulator structure....24

2.4. Regulator with fixed coefficients....25

2.5. Regulators with a non-integer integration and differentiation....27

2.6. Classification of developing direction of methods of the designing of ACS....28

2.7. Adaptive and self-tuning regulators....30

2.8. Adaptive regulators and prospects of this approach....31

2.9. Self-tuning regulators....34

2.10. Robust regulators....35

2.11. Advantages of digital regulators....40

2.12. The two kind of tasks of regulator numerical optimization....42

2.13. Objectives and tasks for the further research....43

3. Visual simulation of unlocked stuctutres....45

3.1. The window of the software VisSim....45

3.2. Start of the working in the software....49

3.3. Tuning of the parameters of the simulation and optimization....51

3.4. Choice of the time sampling step....54

3.5. Choice of the integrating method 56
3.6. Tuning of the parameters of simulation and optimization 60
3.7. Simulation of the response of the linear link 61
3.8. Simulation of the response of non-linear links 64
4. Visual simulation of the locked structures 66
4.1. Simulation of the locked linear system 66
4.2. The differences between theoretical analysis, simulation and practical results 73
5. Statement of the task of optimization of locked structures and tools for its resolving 76
5.1. Demands to the locked loops of the model for simulation 76
5.1.1. Demands for the possibility of simulation 76
5.1.2. Demands to the feedback loop from the point of view of the adequacy of the regulators to their tasks 77
5.1.3. Demands to the cost function 81
5.1.3. Additional demands to the locked systems 83
5.2. Structure for the regulator optimization 84
5.3. Tools of the cost functions 86
5.4. An example of the system quality analysis based on the cost function 91
5.5. Grounds for choosing of weight coefficients in complex cost functions 93
6. Numerical optimization of the locked structures 96
6.1. Procedure for the automatic optimization of regulators 96
6.2. Fixing of the coefficients 104
6.3. Optimization of the ensemble of systems for the robust control 105
6.4. The validity of the model for optimizing of the regulator 108
6.5. Forced limitation of the regulator coefficients 111
6.6. Forced limitation of the frequency range of the model used in optimizing of the regulator 114
7. Dividing of the motion: the use of multiple drives (MISO) 117
7.1. Justification for an excessive number of the influencing actions on the object 117
7.2. Combining of the advantages of the different drives 117
8. Dividing of motions: using of multiple sensors (SIMO) 126
8.1. Combining of the advantages of the different sensors 126
8.2. Simultaneous combing of the advantages of the different sensors and different drives 133

9. Modification of the cost functions 133
9.1. Providing of the power saving 134
9.2. The detector of the error growth 139
9.3. Optimization with the use of etalon transient response 142
10. New structures for single channel objects (SISO) 147
10.1. Robust power saving two-channel regulator with single output 148
10.2. Robust power saving two-channel regulator with single output object, prone to oscillations 154
10.3. Regulator with separation of "right" and "wrong" movements 158
10.4. The use of bypass channel for feedback control of an oscillating object 164
11. Feedback systems with pseudo local loops 172
11.1. About local and pseudo local loops 172
11.2. The control of objects with two integrators 173
11.3. The control of objects with two integrators and non-linear positive feedback 175
11.4. The control of objects with three integrators and non-linear positive feedback 178
12. Design of a piecewise adaptive regulator 189
12.1. Robust system as a prototype of the adaptive system 189
12.2. An example of splitting a set of object parameters into subsets 191
12.3. Identifying the belonging of the object model to a given subset 192
13. Optimization of the regulator for multichannel objects (MIMO) 194
13.1. The task of control of multichannel object 194
13.2. The statement of the problem and the solvability conditions 197
13.3. Methods for solving the problem 199
13.4. The efficiency of the completeness of a PID-regulator when controlling a multi-channel object 200
13.5. The idea of Smith multichannel predictor 209
13.6. Numerical optimization of the regulator for an object of dimension 3×3 232
14. Investigation of the numerical optimization toolkit for control of an oscillatory unstable object 252
14.1. Statement of the problem 253
14.2. Methods for solving the problem, theory and practical results 254
14.2.1. Optimizing the PID-regulator 254

14.2.2. The optimization of PIDD-regulator 256
14.2.3. Bypass channel application 257
14.2.4. Using pseudo-local links and an open object model.....259
14.2.5. The danger of obtaining non-robust solution.....265
14.3. The proposed modification of the known methods 267
14.4. Discussion 271
14.5. Conclusions for the chapter.....272
15. Practical recearch and laboratory works in the field of feedback control in technical universities of Liberec and Sofia 272
16. Questions for control at exams 284
Concluslion 287
Acknowledgments 288
